Exercise Sheet 3

Exercise 1: Fisher Discriminant (10 + 10 + 10 P)

The objective function to find the Fisher Discriminant has the form

$$\max_{oldsymbol{w}} rac{oldsymbol{w}^{ op} oldsymbol{S}_B oldsymbol{w}}{oldsymbol{w}^{ op} oldsymbol{S}_W oldsymbol{w}}$$

where $S_B = (m_2 - m_1)(m_2 - m_1)^{\top}$ is the between-class scatter matrix and S_W is within-class scatter matrix, assumed to be positive definite. Because there are infinitely many solutions (multiplying w by a scalar doesn't change the objective), we can extend the objective with a constraint, e.g. that enforces $w^{\top}S_Ww = 1$.

- (a) Reformulate the problem above as an optimization problem with a quadratic objective and a quadratic constraint.
- (b) Show using the method of Lagrange multipliers that the solution of the reformulated problem is also a solution of the generalized eigenvalue problem:

$$S_B w = \lambda S_W w$$

(c) Show that the solution of this optimization problem is equivalent (up to a scaling factor) to

$$w^* = S_W^{-1}(m_2 - m_1)$$

Exercise 2: Bounding the Error (10 + 10 P)

The direction learned by the Fisher discriminant is equivalent to that of an optimal classifier when the class-conditioned data densities are Gaussian with same covariance. In this particular setting, we can derive a bound on the classification error which gives us insight into the effect of the mean and covariance parameters on the error.

Consider two data generating distributions $P(\boldsymbol{x} \mid \omega_1) = \mathcal{N}(\boldsymbol{\mu}, \Sigma)$ and $P(\boldsymbol{x} \mid \omega_2) = \mathcal{N}(-\boldsymbol{\mu}, \Sigma)$ with $\boldsymbol{x} \in \mathbb{R}^d$. Recall that the Bayes error rate is given by:

$$P(\text{error}) = \int_{\boldsymbol{x}} P(\text{error} \mid \boldsymbol{x}) p(\boldsymbol{x}) d\boldsymbol{x}$$

(a) Show that the conditional error can be upper-bounded as:

$$P(\text{error} \mid \boldsymbol{x}) \leq \sqrt{P(\omega_1 \mid \boldsymbol{x})P(\omega_2 \mid \boldsymbol{x})}$$

(b) Show that the Bayes error rate can then be upper-bounded by:

$$P(\text{error}) \le \sqrt{P(\omega_1)P(\omega_2)} \cdot \exp\left(-\frac{1}{2}\boldsymbol{\mu}^{\top} \boldsymbol{\Sigma}^{-1} \boldsymbol{\mu}\right)$$

Exercise 3: Fisher Discriminant (10 + 10 P)

Consider the case of two classes ω_1 and ω_2 with associated data generating probabilities

$$p(\boldsymbol{x} \mid \omega_1) = \mathcal{N}\left(\begin{bmatrix} -1 \\ -1 \end{bmatrix}, \begin{bmatrix} 2 & 0 \\ 0 & 1 \end{bmatrix}\right)$$
 and $p(\boldsymbol{x} \mid \omega_2) = \mathcal{N}\left(\begin{bmatrix} +1 \\ +1 \end{bmatrix}, \begin{bmatrix} 2 & 0 \\ 0 & 1 \end{bmatrix}\right)$

- (a) Find for this dataset the Fisher discriminant \boldsymbol{w} (i.e. the projection $y = \boldsymbol{w}^{\top} \boldsymbol{x}$ under which the ratio between inter-class and intra-class variability is maximized).
- (b) Find a projection for which the ratio is minimized.

Exercise 4: Programming (30 P)

Download the programming files on ISIS and follow the instructions.
